System High power GNSS interference

HYPNOSIS System

Soft Kill (Non-Kinetic) Air Defense System

High power GNSS interference

HYPNOSIS system is a high -power soft-kill effector, designed to disrupt GNSS signals across multiple frequency bands, constellations, and directions.

NOTABLE ADVANTAGES

- Combat proven Navigation Warfare (NAVWAR) technology
- Total regional protection from precise GNSS-guided threats
- Proven effective against resilient and hardened Positioning, Navigation, and Timing (PNT) systems
- Complimentary solution for Hard-kill defense solution
- Modular, scalable, fully automatic, remotely controlled

To maintain operational superiority, forces should rely on **HYPNOSIS**, a ground-based solution for aerial soft-kill defense. **HYPNOSIS** advanced soft-kill system affects a broad spectrum of air, naval, and land-based threats that relay on GNSS for navigation and timing.

HYPNOSIS system comprises an array of mobile stations that work in unison to form a comprehensive and adaptive effector solution. Each unit is seamlessly connected to a central Command and Control (C2) center, enabling real-time coordination, threat analysis, and rapid response. Strategically deployed around designated protected areas, these stations operate as an integral part of a multi-layered defense architecture.

The system is designed for quick integration into both existing and newly deployed air defense networks, ensuring enhanced operational flexibility and scalability. Its modular architecture allows for effortless compatibility with a wide range of command and control (C2) infrastructures, sensor suites, and defense platforms. This adaptability enables rapid deployment and synchronization with multi-layered defense strategies.

Highly effective against all types of air-breathing treats
